Google android keyboard shortcuts.

Before trying this, make sure that you're on the latest version of Android Studio and the Flutter plugins. Note: If the Run and Debug buttons are disabled, and no targets are listed, Flutter has not been able to discover any connected iOS or Android devices or simulators. Click Finish. Using the Flutter inspector, directly available in Android Studio and IntelliJ. Editing tips for Flutter code If you have additional tips we should share, let us know! Assists & quick fixes Assists are code changes related to a certain code identifier. If dart or flutter are listed, update them. For example if the project is called flutter\_app, open flutter\_app/android. If you haven't run your Flutter app yet, you might see Android Studio report a build error when you open the android project. If you might publish this app, set the company domain. Flutter apps contain a subdirectory named android. You should then see a "Flutter commands" banner at the top of the editor with a link labeled Open for Editing in Android Studio. This can happen, for example, when a ListView is nested in a tall Column that extends offscreen. Locate the Flutter Target Selector drop-down button. If you open this subdirectory as its own separate project in Android Studio, the IDE will be able to fully support editing and refactoring all Android files (like Gradle scripts). The app shown in this screenshot has been designed to deliver poor performance, and the rebuild profiler gives you a clue about what is happening in the frame that might cause poor performance. As the code runs, the spinning icons also display in the code pane to help you visualize which rebuilds are happening. Right click the binding you want to change and Add Keyboard Shortcut. Convert child to children assist Changes a child argument to a children argument, and wraps the argument value in a list. Editing Android code in IntelliJ IDEA To enable editing of Android code in IntelliJ IDEA, you need to configure the location of the Android SDK. In Preferences > Plugins, enable Android Support if you haven't already. Typically you should only worry about excessive rebuilds if you have already run the app in profile mode and verified that the performance is not what you want. The bottom Debugger pane shows Stack Frames and Variables. Run app without breakpoints Click the Play icon in the toolbar, or invoke Run > Run. The build() function for an AnimatedBuilder draws a subtree that does not need to be animated, causing unnecessary rebuilds of static objects. If you think you might ever release this app, it is better to specify these now. When you connect devices, or start simulators, additional entries appear. If widgets are rebuilding that you didn't expect, it's probably a sign that you should refactor your code by splitting up large build methods into multiple widgets. To view the performance data, including the widget rebuild information, click the app in Debug mode, and then open the Performance tool window using View > Tool Windows > Flutter Performance. Prefix stlclass: Create a new subclass of StatefulWidget and its associated State subclass, including a field initialized with an AnimationController. If you already have the entire project opened as a Flutter app in Android Studio, there are two equivalent ways to open the Android files on their own for editing in the IDE. Click that link. Note that numerous rebuilds doesn't necessarily indicate a problem. Test the app's performance on a real device in a profile build, but debug performance issues in a debug build. OR, you can open any of the files under the android subdirectory for editing. An Opacity widget is placed unnecessarily high in the widget tree. They are indicated with a red lightbulb. The bottom Console pane shows detailed logs output. Enter your desired Project name, Description and Project location. Navigating to type declarations (Navigate > Declaration), and finding type usages (Edit > Find > Find Usages). Your organization name should be unique. Or, an Opacity animation is created by directly manipulating the opacity property of the Opacity widget, causing the widget itself and its subtree to rebuild. In the Sources tab, locate the Language level field, and select level 8 or later. Live templates Live templates can be used to speed up entering typical code structures. To customize this, click the drop-down button to the right of the device selector, and select IDE configuration. Make sure to select an Android SDK matching the one used by Flutter (as reported by flutter doctor). Split up the UI into smaller widgets with smaller build() functions. Click the Debug icon in the toolbar, or invoke Run > Debug. In the "project view", you should see a subdirectory immediately under the root of your flutter app named android. Right click on it, then select Flutter > Open Android module in Android Studio. When creating a new app, some Flutter IDE plugins ask for an organization name in reverse domain order, something like com.example. Along with the name of the app, this is used as the package name for Android, and the Bundle ID for iOS when the app is released. You can click on a line in the table to navigate to the line in the source where the widget is created. Show performance data Note: To examine performance issues in Flutter, see the Timeline view. When filing new issues, include the output of flutter doctor. Viewing all current source code problems (View > Tool Windows > Dart Analysis), hot restart Hot reload works by injecting updated source code files into the running Dart VM (Virtual Machine). Offscreen widgets are being rebuilt. They are invoked by typing their prefix, and then selecting it in the code completion window: The Flutter plugin includes the following templates: Prefix stlclass: Create a new subclass of StatelessWidget. This shows a list of available targets. If no SDK is listed, click New and specify the location of the Android SDK. Running and debugging are controlled from the main toolbar: Selecting a target When a Flutter project is open in the IDE, you should see a set of Flutter-specific buttons on the right-hand side of the toolbar. Either option is fine. Fast edit and refresh development cycle Flutter offers a best-in-class developer cycle enabling you to see the effect of your changes almost instantly with the Stateful Hot Reload feature. Keyboard shortcuts Hot reload On Linux (keymap Default for XWin) and Windows the keyboard shortcuts are Control+Alt+, and Control+Backslash. For widgets that aren't rebuilt, a solid grey circle displays. The purpose of this feature is to make you aware when widgets are rebuilding—you might not realize that this is happening when just looking at the code. Click OK. This tool can help you debug at least four common performance issues: The whole screen (or large pieces of it) are built by a single StatefulWidget, causing unnecessary UI building. In the Dependencies tab, locate the Module SDK field, and select an Android SDK. See Hot reload for details. The widget rebuild profiler is not a diagnostic tool, by itself, about poor performance. Under Project location enter, or browse to, the directory holding your existing Flutter source code files. Open the android subdirectory immediately under the flutter app root. Tips and tricks Troubleshooting Known issues and feedback Important known issues that might impact your experience are documented in the Flutter plugin README file. Hot reload vs. Debugging is based on a default launch configuration. For both options, Android Studio gives you the option to use separate windows or to replace the existing window with the new project when opening a second project. You should be prompted in the IDE when an update is available. To perform a hot restart, don't click the Stop button, simply re-click the Run button (if in a run session) or Debug button (if in a debug session), or shift-click the 'hot reload' button. Creating a new project from existing source code To create a new Flutter project containing existing Flutter source code files: In the IDE, click Create New Project from the Welcome window or File > New > Project from the main IDE window. On macOS (keymap Mac OS X 10.5+ copy) the keyboard shortcuts are Command+Option and Command+Backslash. Select the target you want your app to be started on. For information on launching DevTools, see Running DevTools from Android Studio in the DevTools docs. Editing code and viewing issues The Flutter plugin performs code analysis that enables the following: Syntax highlighting. Make sure you have updated to the most recent version of the plugin. The assist can be invoked by clicking the lightbulb, or by using the keyboard shortcut (Alt+Enter on Linux and Windows, Option+Return on macOS), as illustrated here: Quick Fixes are similar, only they are shown with a piece of code has an error and they can assist in correcting it. This can be used when you have a widget that you want to wrap in a surrounding widget, for example if you want to wrap a widget in a Row or Column. To check for updates manually: Open preferences (Android Studio > Check for Updates on macOS, Help > Check for Updates on Linux). If you don't already have the Flutter project opened in Android studio, you can open the Android files as their own project from the start: Click Open an existing Android Studio Project on the Welcome splash screen, or File > Open If Android Studio is already open. Creating projects You can create a new project in one of several ways. Important: Do not use the New > Project from existing sources option for Flutter projects. Creating a new project To create a new Flutter project from the Flutter starter app template: In the IDE, click New Project from the Welcome window or File > New > Project from the main IDE window. The instructions below describe features available in Android Studio and IntelliJ. Updating the plugins Updates to the plugins are shipped on a regular basis. A number of these are available when the cursor is placed on a Flutter widget identifier, as indicated by the yellow lightbulb icon. Right-click the Flutter folder in the Project view, and select Open Module Settings. The bottom Run pane shows logs output. For a high number of rebuilds, a yellow spinning circle displays. Prior to filing new issues: Do a quick search in the issue trackers to see if the issue is already tracked. Select Flutter in the menu, and click Next. DevTools replaces the previous browser-based profiling tool, Observatory. Any analysis issues are shown in the Dart Analysis pane: Running and debugging Note: You can debug your app in a few ways. Run app with breakpoints If desired, set breakpoints in your source code. Editing Android code in Android Studio with full IDE support Opening the root directory of a Flutter project doesn't expose all the Android files to the IDE. A few types of code changes cannot be hot reloaded though: Global variable initializers Static field initializers The main() method of the app For these changes you can fully restart your application, without having to end your debugging session. This includes not only adding new classes, but also adding methods and fields to existing classes, and changing existing functions. To see the stats about which widgets are being rebuilt, and how often, click Show widget rebuild information in the Performance pane. Otherwise, a grey spinning circle displays. You need to connect a device, or start a simulator, to proceed. All known bugs are tracked in the issue trackers: Flutter plugin: GitHub issue tracker Dart plugin: JetBrains YouTrack We welcome feedback, both on bugs/issues and feature requests. Using Android Studio's (or IntelliJ's) built-in debugging features, such as the ability to set breakpoints. Code completions based on rich type analysis. Using DevTools, a suite of debugging and profiling tools that run in a browser and include the Flutter inspector. You can also define custom templates in Settings > Editor > Live Templates. Run flutter pub get in the app's root directory and rebuild the project by selecting Build > Make to fix it. And remember, the widget rebuild information is only available in a debug build. The column to the far right shows how many times a widget was rebuilt since entering the current screen. Keyboard mappings can be changed in the IDE Preferences/Settings: Select Keymap, then enter flutter into the search box in the upper right corner. Or when the RepairBoundary is not set for a list that extends offscreen, causing the whole list to be redrawn. Specify the Flutter SDK path and click Next. Prefix stlclass: Create a new subclass of StatefulWidget and its associated State subclass. App Size: 2.1M Release Date: Sep 13, 2018 Price: Free Contents Follow the Set up an editor instructions to install the Dart and Flutter plugins. They cannot be changed once the app is released. The exact count of the rebuilds for this frame displays in the second column from the right. Similar to the assist above), but for wrapping an existing list of widgets rather than an individual widget.
